

Domain architecture analysis

Display all proteins with similar:

- [Domain organisation](#): Proteins having all the domains as the query in the same order. Additional domains are allowed.
- [Domain composition](#): Proteins with the same domain composition have at least one copy of each of domains of the query.

The SMART diagram above represents a summary of the results shown below. Domains with scores less significant than established cutoffs are not shown in the diagram. Features are also not shown when two or more occupy the same piece of sequence; the priority for display is given by SMART > PFAM > PROSPERO repeats > Signal peptide > Transmembrane > Coiled coil > Unstructured regions > Low complexity. In either case, features not shown in the above diagram are marked as 'overlap' in the right side table below.

Confidently predicted domains, repeats, motifs and features:				Features NOT shown in the diagram: ?			
Name	Start	End	E-value	Name	Start	End	E-value Reason
low complexity	9	33	N/A	NUC194	7	391	156000 threshold
